
Student Performance Analysis

— Amandaliss Dropik —

The Problem

- In general, there seems to be a division between male and female academic performance
- We want to figure out which sex performs best, and why
 - At a glance, there would seem to be many contributions to academic failure or success
- Eventually, we want to be able to predict grades based on these factors
- This information can be used by universities to makes positive changes

Background

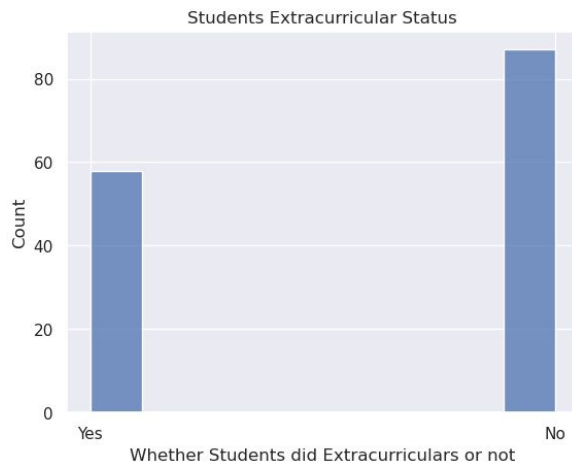

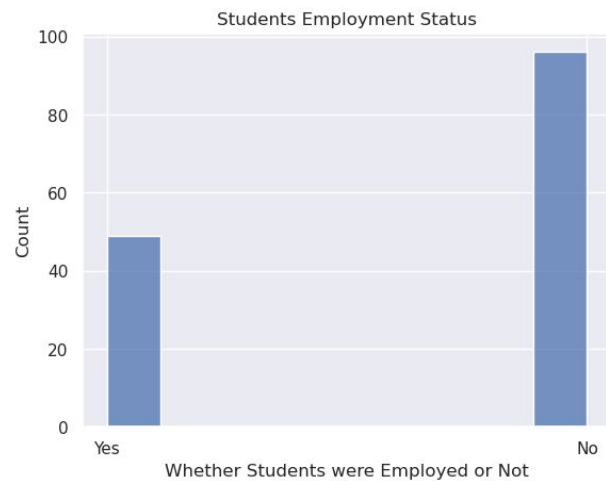

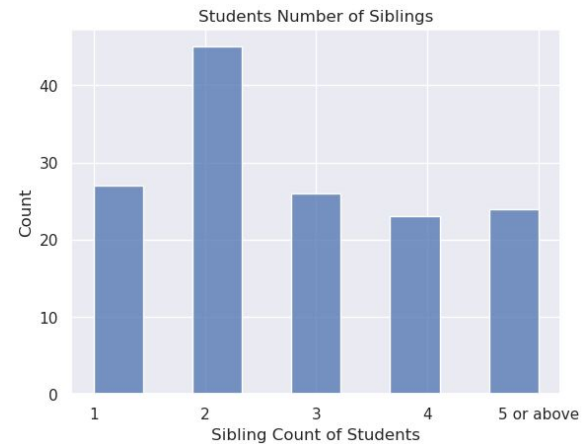

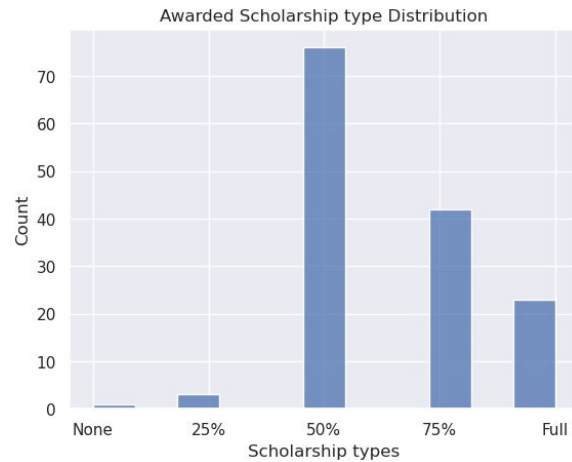

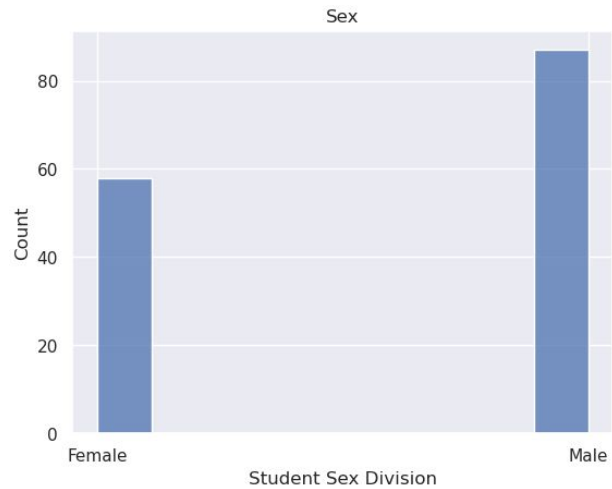

- There have been many studies on the differences between males and females in academics
 - Many different conclusions as well
- After reading some papers, it is generally accepted that females tend to do better academically
 - This is reflected in graduation rates, drop out rates, workforce statistics and more
 - If we look at specifics, there are sectors (like the sciences) where men will have more success
- Main piece of literature referenced for this project was [Conscientiousness as a Predictor of the Gender Gap in Academic Achievement by Verbree et al \(2022\)](#)

Data Set

- [Students Performance by Joakim Arvidsson](#)
- Dataset of 145 students
- 33 features
 - Consists of personal and academic information
- Chosen because of the wide range of information taken from students
- Output is grade for each student
- Dataset came preprocessed and clean
 - Minimal changes done like removing unnecessary columns

Questions To be Answered with Analysis

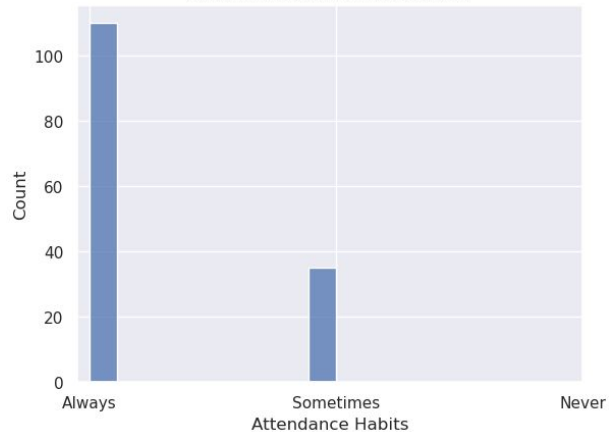

1. Which sex performs better in school?
2. Does having a commitment outside of school negatively impact your grade?
3. How impactful is cramming for exams on your grade?
4. Is it better to study more than 5 hours a week?
5. Does attending seminars/conferences related to your department impact your grade?
6. Is attending class necessary for a good grade
7. Does studying with classmates negatively or positively impact your grade?
8. How much does note-taking during class determine your success?
9. How much does listening during class determine your success?

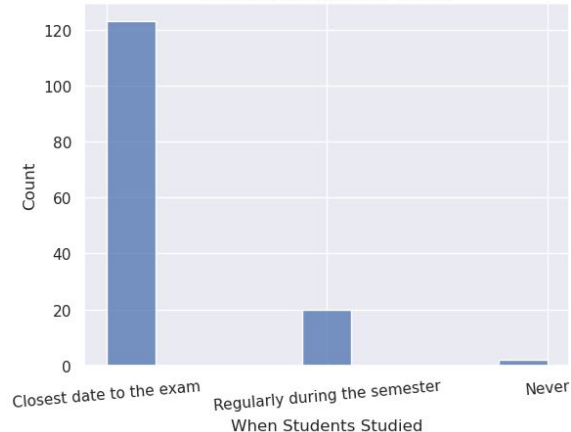

Students Weekly Study Hours

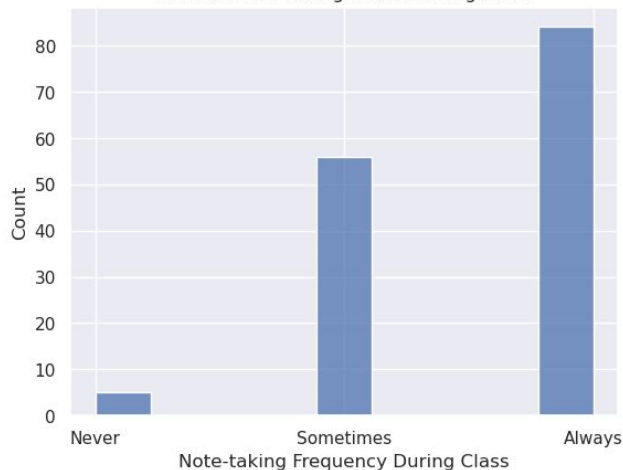

How Often Students Attend Class

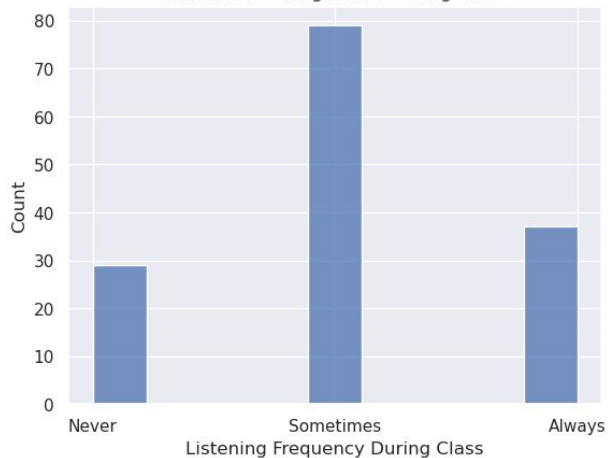

Student Preparation for Exams

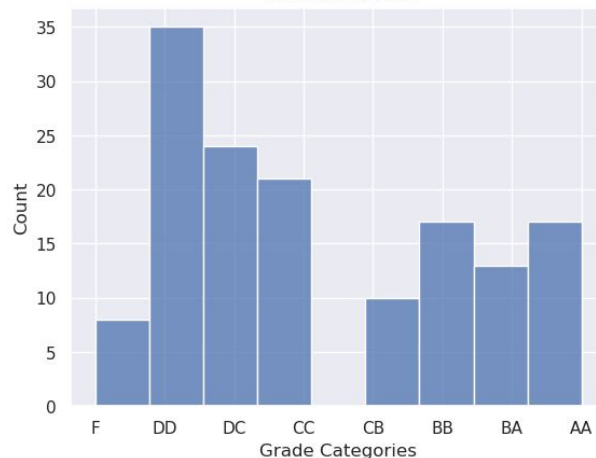

Student Note-taking Habits During Class

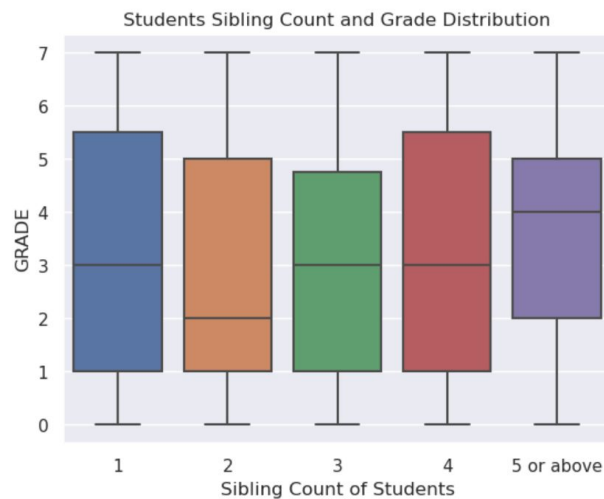

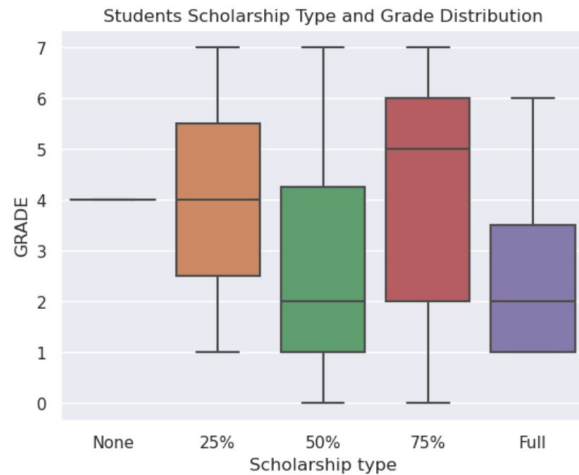

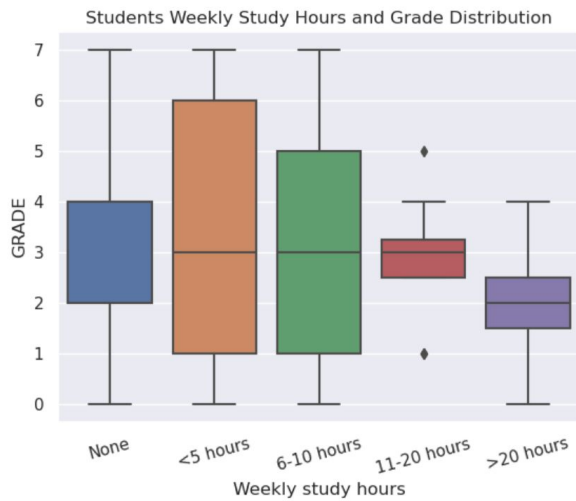

Student Listening Habits During Class

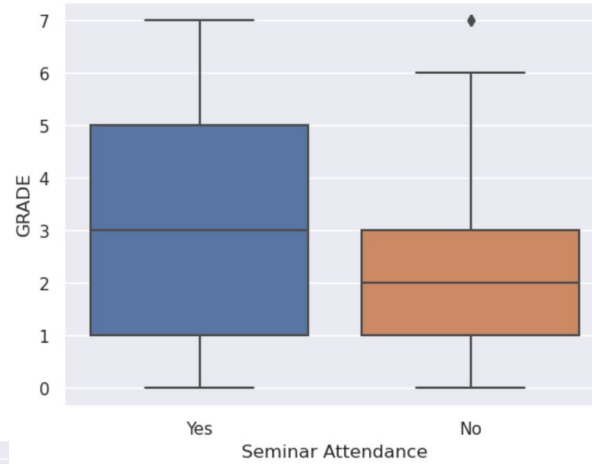

Students Grades

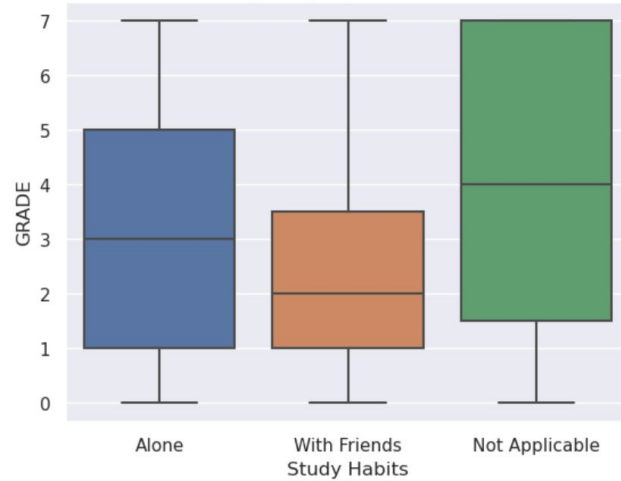

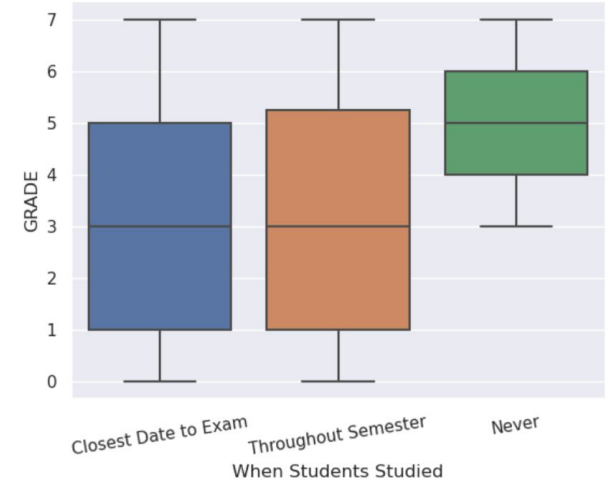

Students Seminar/Conference Attendance and Grade Distribution

Students Study Company and Grade Distribution

When Students Studied for Exams and Grade Distribution

Answers to earlier questions

1. This data set suggests males do better
2. There is only a slight impact if you are employed, and none with extracurriculars
3. Seems to have no significant impact on grade
4. Studying for longer than 5 hours appears to lower grade
5. Attending seminars does positively impact grade
6. This data set suggest there is no significance towards grade
7. Studying with others has a moderate significance
8. Seems to positively impact grade
9. Might slightly impact grade

Methodology

- Random Forest Regressor
 - RMSE of ~2.057
 - Pearson's Correlation
 - Sex: 0.3355 (moderate correlation)
 - Cumulative grade point average in the last semester: 0.3155 (moderate correlation)
 - Expected cumulative grade point average in the graduation: 0.2486 (weak correlation)
 - Feature Importance
 - Cumulative grade point average in the last semester: 0.1146
 - Father's education: 0.0683
 - Sex: 0.0657

Methodology

- Random Forest Classifier explanations
 - Accuracy: .2273
 - Feature Importance:
 - Sex: 0.0862
 - Cumulative grade point average in the last semester: 0.2642
 - Expected Cumulative grade point average in the graduation: 0.1933
 - Reading frequency: 0.1405
 - Attendance to classes: 0.0893
 - Weekly study hours: 0.2265
 -

Classification Report:				
	precision	recall	f1-score	support
0	0.00	0.00	0.00	5
1	0.32	0.60	0.41	10
2	1.00	0.11	0.20	9
3	0.33	0.17	0.22	6
4	0.00	0.00	0.00	3
5	0.17	0.33	0.22	3
6	0.00	0.00	0.00	5
7	0.14	0.33	0.20	3
accuracy			0.23	44
macro avg	0.24	0.19	0.16	44
weighted avg	0.34	0.23	0.19	44

Confusion Matrix:

```
[[0 3 0 0 0 0 2 0]
 [1 6 0 0 0 0 0 3]
 [2 3 1 0 2 1 0 0]
 [0 2 0 1 1 2 0 0]
 [0 1 0 0 0 1 0 1]
 [0 2 0 0 0 1 0 0]
 [0 1 0 1 0 1 0 2]
 [0 1 0 1 0 0 0 1]]
```

Methodology

- Linear Regression
 - RMSE: ~2.927
 - R-squared: -0.8801

	True Grades	Predicted Grades
69	5	0.795585
140	5	1.608887
27	1	0.399065
19	3	1.860659
42	1	3.636620
117	1	-0.216083
126	3	2.236299
108	6	0.939197

Results

- Some of the features I thought would impact the grades did not do so as much as I thought, or at all
- Random Forest Regressor was the best model for this data
 - With that said, still did not perform that well
- After finishing this project, I can conclude that the dataset is probably the issue here
